3a

Wallpaper browser

A fullscreen surface in the 2a theme, sized for the things skwd-wall actually does: mixed image / video / scene sources, remote browsing, heavy filtering across thousands of files, per-monitor targeting, and the matugen palette that comes out the other end. The palette preview is the important part — you are picking a system theme, not a picture, so the derived roles sit next to the thumbnail before you commit.

WHY IT IS LAID OUT THIS WAY

Three thousand files means the left rail earns its width — every filter shows a live count so you can see a query narrow before you run it. Type badges sit in the thumbnail's top-left corner rather than on hover, because a grid of mixed images, video and scenes is unreadable otherwise: VID and SCN are coloured, IMG is grey since it is the common case. Two apply buttons, not one — swapping the picture and re-theming the whole system are different intentions and should not share a keystroke.

2a

Quiet Tron

Same sharp mono bones as 1a, four changes. Corners are chamfered rather than square. Meters read as segments instead of solid fills. The bar breaks into detached modules with a single hairline rule beneath. One cyan accent, at full strength on exactly one thing per panel — active workspace, selected result, the number you are currently changing. Everything else stays grey.

RULES THAT KEEP IT RESTRAINED

One chamfer size per panel tier — 14px on floating panels, 8px on bar modules, 5px on icons. Chamfer only the two corners a panel is not anchored against, so a top-right panel keeps square edges where it meets the screen. Full-strength primary appears at most twice per panel; everything else is grey. No glow, no scanlines, no drop shadows — depth comes from the 1px outline and the backdrop blur alone. Segmented meters use 20 cells for values you set by hand and 18 for telemetry, so a glance tells you which is interactive.
